Chapter 6 Discussion and Conclusions

References

Appendix 1 South Eastern Population Health Survey 2001 Questionnaire

Appendix 2 Age and Sex Standardised Normative Data Calculation

Description

This report is based on the results of the survey of over four thousand people, randomly selected from the population of the south east region. It can be used for comparative purposes for clinical and population-based work nationally and internationally. It also adds to the body of work on health inequalities, with unemployment, GMS status and older age shown as the greatest predictors of poor health status.
