Chronic disease and multimorbidity

Lifestyle Risk Factors

Physical examination

Clinical measurements

Blood test results

HbA1c in patients with a diagnosis of diabetes

Vaccination

Dyspnoea Score

Care Plan

Hospital attendance

Discussion

Conclusion

Description

This second report again describes the above parameters and builds on the information included in the first report to include all anonymised data returned for

Treatment Programme clinical encounters imported into the system between 1st January 2020 and 20th January 2022. This date range was chosen for the second report to include all patients in the first phase of the Treatment Programme, before the changes to the data collection system were rolled out in phase two, in order to ensure comparability of findings across the patient cohort. Hence, this second report refers to patients treated by General Practitioners (GPs) for the first two years of the programme and comprises 186,210 patients in total.
